

## VT Miltope Becomes IUID Compliant

“ I was quickly impressed by A2B’s knowledge of IUID policy and technology, responsiveness, and the ability to work closely with a veteran barcode label expert to design the right label for VT Miltope. ”

– Shane Kelley

### The Problem

With decades of design and development experience, VT Miltope meets the stringent standards of MIL-STD-810, MIL-STD-461, FCC Class B, RCTA DO-160 and IEEE 802. Now VT Miltope can add another standard to that list – MIL-STD-130N. With manufacturing engineer Shane Kelley as the point man, the company has been proactive in meeting the stringent new requirements mandated under the new Department of Defense unique identification (IUID) policy.

However, with a new contract in hand, Shane knew he needed to get up to speed quickly in order to meet all contract requirements, including IUID item marking compliance. Four new devices would require the IUID label. In addition, the labels would need to be verified, validated and uploaded to the new IUID Registry in order to be compliant.

### The Plan of Attack

After an ample amount of research surrounding IUID item marking compliance, Shane decided to go with A2B Tracking Solutions.

Because VT Miltope’s products are subjected to harsh environments and temperatures ranging from -40°F to 160°F, label material and choice was of paramount importance. After thorough investigation, thermal transfer polyester labels were chosen. A2B supplied the label printing system so that new, customizable IUID labels could be printed in-house.

### The Results

In the end VT Miltope chose UC! Web™, a lifecycle management system from A2B, because the Implementation Team was impressed by the depth of knowledge A2B demonstrated during a webinar presentation to the group.

“ We also appreciated that A2B offered full implementation capability,” says Shane. “Other vendors could take implementation only so far, and then they would subcontract for other requirements and technologies. We wanted one point of responsibility. ”
